

Technical Document #145: Cybersecurity - Comprehensive Overview

Technical Document #145: Cybersecurity - Comprehensive Overview

Multi-factor authentication (MFA) requires multiple forms of verification. It significantly reduces the risk of unauthorized access.

Security information and event management (SIEM) systems collect and analyze security logs. They provide real-time visibility into security events.

Intrusion detection systems (IDS) monitor network traffic for suspicious activity. They alert administrators of potential security breaches.

Federated learning trains models across decentralized data sources without sharing raw data. It enables privacy-preserving machine learning.

Edge computing processes data closer to its source, reducing latency and bandwidth usage. It is essential for real-time applications like autonomous vehicles.

Augmented reality overlays digital information on the physical world. It has applications in training, maintenance, and entertainment.

Key Takeaways:

- Network segmentation divides networks into smaller segments.
- Social engineering manipulates people into revealing confidential information.
- Security information and event management (SIEM) systems collect and analyze security logs.
